

155 kPa × activation 1: source-anchored educational block

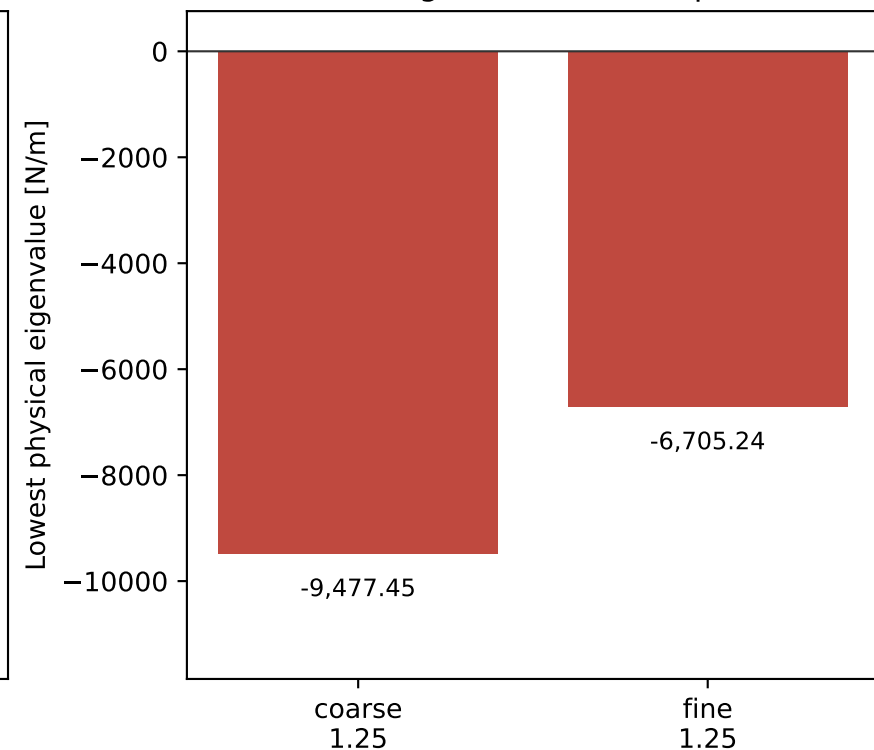

Force passing alone is insufficient

Accepted matched-static specimens

Verified negative curvature persists

Coarse stretch 1.01: pointwise pressure RMS $3.35 \times 10^{-4} > 10^{-6}$; no refinement or curvature classification.
Matched $\alpha = 87.084$ kPa preserves the original -4293.9875 N/m witness. New runs use $\alpha = 155$ kPa.
Source: skinned human VL, 15°C cohort mean. Authored static block; no force-length, arm or clinical validation.
Euclidean nodal spectra are mesh dependent; no continuum spectrum-convergence claim.
