

Carried contractile state adds fast response; the negative mode returns

Matched nominal-force scale: 155 kPa · initial total cap force 39.76115 N · educational strain gain 130

24 retained continuous-density histories · independent endpoint tangent · same frozen 1.25 block

Active axial endpoint response

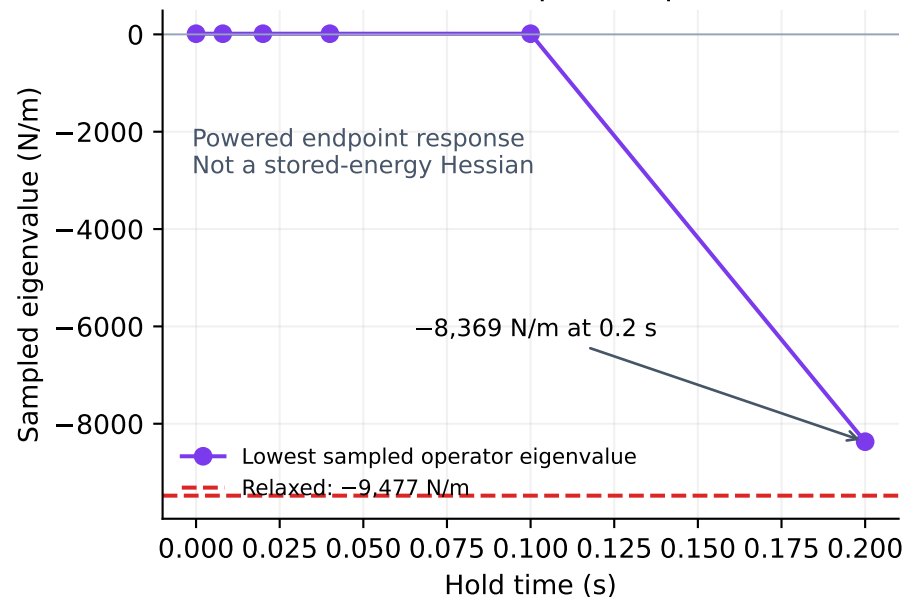

480 fixed gates pass · worst endpoint derivative error 7.40×10^{-7} (gate 10^{-4}) · time/space density gates retained

Positive fixed-transverse point response does not imply a positive block operator. Active input is separate from passive storage.

Composite educational experiment · no new nonlinear trajectory · no ATP/heat closure · no anatomical or clinical validation

Frozen block response operator

Active hold energy channels (+.001)
